

# The Value of CEMA Safety Labels

CONVEYOR EQUIPMENT MANUFACTURERS ASSOCIATION  
Chris Glenn, Vice President of Operations  
Hytrol Conveyor Co., Inc.

As a major manufacturer of conveyor equipment, there are many challenges to delivering a product to your customers. Streamlining items through standardization is one way that many overcome some of those challenges. **CEMA's safety labels** are a standard that allow conveyor equipment manufacturers to focus their attention on other characteristics of the product.

**“The dynamic pace that manufacturing operates in today’s world is more demanding than ever. Developing new products and the associated documentation in this accelerated environment can be a huge task for companies.”**

The paramount objective in this development is product safety. Most industries do not have an association that develops safety standards as it relates to the equipment manufactured. This leaves all the development activities for labels and documentation to individual companies. It can be tasking on resources from engineering to marketing to purchasing in these organizations.

CEMA fills this gap in the conveyor industry, by creating a venue for common safety practices among member companies. One of CEMA's goals is to promote **conveyor safety** and develop **standards for the industry**. As a result, standard safety labels have been created for conveyors that can be utilized by all manufacturers. These labels are applicable to a variety of conveyor industries, and are available to non-members as well.

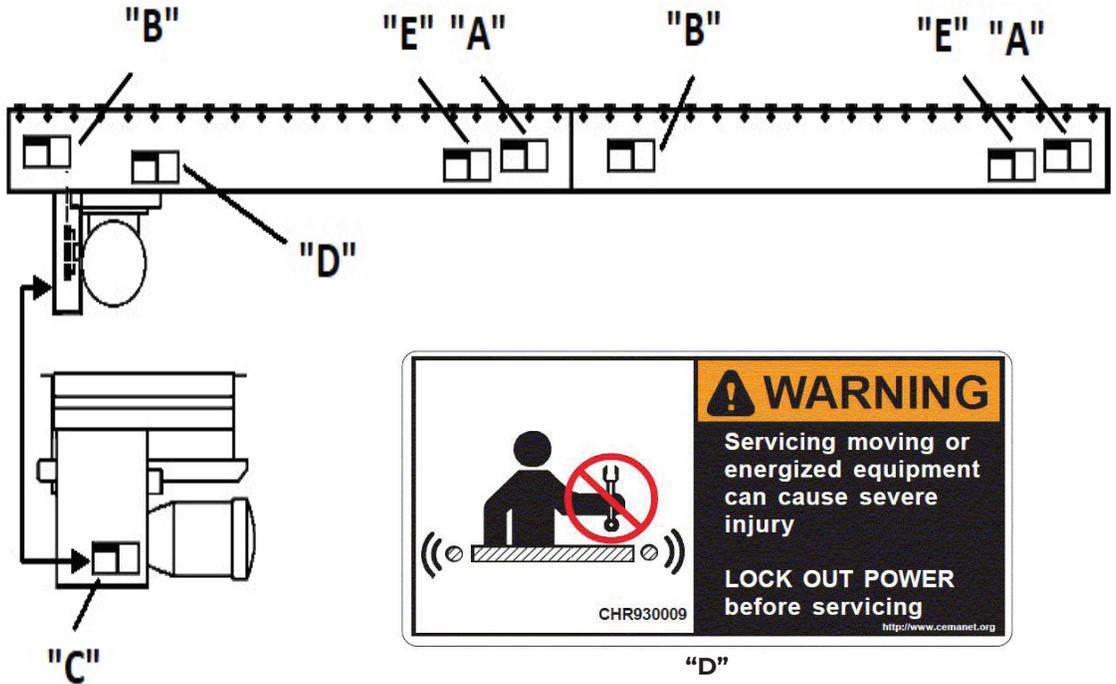

**Caution, Warning, and Danger are words along with graphics used on these labels to help identify hazards. Examples of the labels are as follows:**

Things as simple as adhesion of the labels have already been perfected for use on conveyor products. These labels provide a foundation of safety messages for the end users of the conveyor equipment.

For additional information on CEMA Safety Labels, go to [CEMA's website](http://www.cemanet.org).

There are also **safety placement guidelines** published as well to help your employees know where to apply labels as the equipment is completed.

CEMA can be an important piece of your entire conveyor safety program. They also publish safety **videos**, **safety posters** and **technical information** that can be valuable to conveyor manufacturers.

CEMA makes it simple to adopt industry standard safety practices through application of their labels. The hazards covered utilizing these labels will address all your needs as it relates to conveyor equipment. They address operational and maintenance hazards and allow you to feel confident about labeling equipment for your customer to promote a safe workplace.
